EGG PRODUCTION

MOTOMCO iQ™

FDA COMPLIANCE $ + LABOR SAVINGS

REDUCING RODENT POPULATIONS

Rodents can spread disease, consume and contaminate feed and damage buildings. Knowing where and when they are active is key to reducing populations on your farm, helping you bait more effectively and efficiently.

Tomcat Titan or Bullet Stations with iQ trays on the exterior and interior of buildings will gather rodent data and provide "early warning detection" of a spike in rodent counts.

In hard to reach areas like attics or manure pits, iQ Traps and stations can notify you of activity without having to physically check every location.

DISEASE PREVENTION

Rodents are a major vector for disease in egg production, spreading salmonella, e.coli and other pathogens. Rodent control is critical to protecting your flock and eggs from foodborne illness that could potentially trigger a recall or depopulation.

Checking traps and recording mouse counts every week is a time consuming, labor intensive process. Live Catch iQ Traps will tell you where you have activity, eliminating the need to check every single trap and making it easier to track and record data.
